Appendix C. Distribution of Vehicle Technologies Based on Video and Parked Vehicle Data Collected During this Study .....	C1-C4

## **Acknowledgements**

We gratefully acknowledge the financial support provided by the US Environmental Protection Agency and CONAMA, the air pollution control agency for Chile, for this study. We particularly want to thank Ms. Jane Metcalf, U.S. EPA Office of International Affairs, and Mr. John Koupal, U.S. EPA Office of Mobile Sources, as well as Mr. Gianni Lopez, Director of CONAMA, and Dr. Pedro Oyola, advisor to CONAMA for their active individual support of the project.

## **Chapter One: Overview**

---

A necessary information base for the calculation of on-road vehicular emissions is the distribution of technologies that are operating on the roads and at the times of interest. This distribution must relate to the amount of driving that is being carried out by each type of technology. A simple approach is to randomly count the number and types of vehicles that are operating on the roads and at the times of interest. Such a count will relate to the rate of driving of the various vehicular technologies recorded since they will be observed in the proportion to the amount of driving that is occurring.

A problem with this approach is the difficulty in making such counts on busy multilane roads and identifying the attendant technologies in real time. This problem can be partially remedied by video taping the traffic. The videotapes can then be studied at leisure and in slow motion to achieve accurate vehicle counts and to identify attendant technologies. Modern digital tapes can be freeze-framed as needed producing relatively high-resolution pictures for careful study if necessary. This approach was used in Los Angeles [Malcolm et al., 2002] to acquire license plate numbers with excellent results.

Even with the resulting resolution, however, it is very difficult or impossible with respect to most vehicles to determine actual engine technologies, fuel, and emissions controls. The odometer readings of the vehicles are also not accessible using this approach. Even with this limitation, it is easy to review videotapes to establish the relative numbers of passenger cars compared to trucks, buses, and taxis and to make a reasonable estimate of vehicle sizes and even ages by simply carefully observing the collected tapes.

The variety of technologies with respect to passenger cars can vary widely in the modern fleet. In a developing country, the passenger vehicle fleet can contain uncontrolled, carbureted vehicles operating alongside modern multi-point injection, 3-way catalyst vehicles with emissions that are 1% of the uncontrolled vehicles. It is important to understand the relative proportions of passenger vehicle technologies to properly evaluate the emissions of the on-road fleet. Vehicle registration information is often used to establish these types of information in the United States and elsewhere. Unfortunately, such information is often not available or unreliable in developing countries. An alternate process is to examine an appropriate subset of the passenger vehicle fleet in the region of interest to establish information on the distribution of specific passenger vehicle technologies. Since stopping vehicles for this purpose is not normally practical, an alternate approach is to examine vehicles that are parked at representative locations in the region of interest. The assumption that must be made is that the observed vehicular technologies found in grocery store, shopping center, and industrial parking lots and roadside parking are reasonably representative of vehicular activity.

The range of vehicular technologies associated with trucks and buses are typically more limited today especially in developing countries. Thus, the videotape information is adequate for most analysis. If the variety of vehicular technologies associated with buses and trucks should be significantly subdivided, then trucks and buses can be randomly inspected to establish the distribution of technologies. Care must be taken in this process to examine these technologies in a manner that produces results in reasonable proportion to vehicular activity.

This study consists of the collection of data by video taping vehicles on roads and by randomly sampling parked vehicles. The parked car sampling process was carried out over several days and collected data on close to a thousand vehicles. The video taping process allowed the collection of information on several thousand vehicles.

## **Chapter Two: Videotaping Vehicular Activity**

---

Digital video cameras were used for the capture of on-road traffic. A two-person team was used to setup and operate the videotaping cameras. Two cameras were used to capture information at each location. One camera was set up to observe all lanes of traffic and a second camera was set up to observe vehicle detail and vehicle occupancy. The general tapes were reviewed to make appropriate vehicular counts for traffic analysis. The close-up tapes will be reserved for later analysis.

Videotaping was carried out over six days within a period of 6 hours each day. The three locations videotaped consisted of a generally poor area, a commercial area, and an upper income area. In each of these areas, three types of roads were videotaped consisting of a major arterial (or freeway if available), a local arterial, and a residential street. This results in videotapes collected from nine representative locations in the region of interest. In order to create as much randomness in the observations as possible, videotaping was carried out for 20-minute intervals in each hour and then the cameras were rotated to the next roadway type.

The videotaping was alternated on different days between the morning and the evening. The morning hours used were 7am to 1pm. one day and the evening hours used were 3pm until 9pm.<sup>1</sup> Three 20 minute tapings were collected on each one-hour digital videotape resulting in 24 videotapes for the two cameras at the nine locations over six days.

The videotapes were reviewed in the office and the observed traffic broken into 12 categories indicated by an "X" in Table 2.1. Figure 2.1 shows the videotaping process.

**Table 2.1: Vehicle Technologies Recorded from Digital Videotapes**

Vehicle Size	Passenger Cars	Trucks	Buses	Taxis	Motorcycles
Small	X	n/a	X	X	X
Medium	X	X	X	X	n/a
Large	X	X	X	X	n/a

Tables 2.2a-c show the results from the videotaping for the nine sites that were monitored.

---

<sup>1</sup> The intention is to record a morning and evening in each location of interest. In the case of Santiago, Chile, the desired time order was disrupted so that the videotaping in the upper income area occurred in the morning hours while the videotaping in the lower income area occurred in the evening hours..

Overall, the passenger vehicles observed to be operating in Vitacura, the higher income district, were larger than the passenger vehicles operating in Maipu, a generally lower income district. The relative distributions of taxis, buses, motorcycles, and trucks are shown in Figure 2.2. The Maipu area appears to favor taxis over buses based on these observations compared to the Santiago and Vitacura districts.<sup>2</sup> Taxis represent a small proportion of the overall fleet, and more motorcycles can be found in the Santiago and Vitacura districts compared to the Maipu district. Figure 2.2 also includes data from a Chilean government publications [Instituto Nacional de Estadísticas]. The Chilean data reflect the fraction of vehicles in the fleet rather than their activity. Thus, taxis are about 5% of the static fleet, but make up 6-12% of the driving in various locations. Similarly, Buses are about 2.4% of the static fleet, but make up 3-8% of the driving observed in various locations. Motorcycles and Truck activity rates agree reasonably well with the static fractions in the government report.

<sup>2</sup> This would appear to be counterintuitive and may reflect a bias resulting from the video taping locations selected for Maipu.

**Figure 2.2: Distribution of Taxis, Buses, Motorcycles, and Trucks in Parts of the Santiago Metropolitan Area Based on Video Collected Data Compared with Chilean Government Data**

## **Chapter Three: Parked Vehicle Technology Recording**

---

A two-person team visited grocery store, shopping center, and business parking lots and on-road parking in each of the areas selected for videotaping. Parked car data collection was carried out over the same 6-hour period that videotaping occurred.

One team member recorded general information about the vehicle while the second team member collected odometer readings where visible, transmission type, and air conditioning information by looking through the vehicle windows. Table 3.1 indicates the vehicle parameters collected.

**Table 3.1: Vehicle Information Recorded**

Information Collected	Comment
Manufacturer	Almost always available
Model	Almost always available
Engine Size (liters)	Sometimes indicated on the vehicle. Otherwise estimated and later checked from information provided by the manufacturers
Model Year	Estimated from license plate in Santiago. Otherwise by observation.
Vehicle Condition	Subjective estimation.
Catalyst	In Santiago, all catalyst vehicles were required to have an easily observable green sticker. Otherwise, a catalyst was looked for in the exhaust train of the vehicle.
Odometer Reading	Recorded by looking through the window. Not visible in some cases and many 2001 vehicles have digital odometers, which are not visible when the vehicle is not operating.
Transmission Type	Recorded by looking through the window of the vehicle
Air Conditioning	Recorded by looking through the window of the vehicle.
Fuel Type	Based on indication on vehicle. Otherwise by knowledge of the vehicle model and looking at the exhaust pipe.
Licenses Number	Recorded from vehicle plates.

The data collected in the walk-around portion of the study is presented in Appendix A. Data from 814 vehicles was collected over six days of field studies. While this represents a significant dataset, there is still room for sampling errors especially in cases where the data is parsed into subgroups. A fundamental assumption used in this study is that people act somewhat randomly around norms producing driving statistics that should represent relatively smooth patterns with a standard statistical type of character. When samples appear to differ from these smooth patterns, it is assumed that traditional processes such as least square fits and other curve smoothing processes will work to improve the representativeness of the acquired data.

## Passenger Vehicles

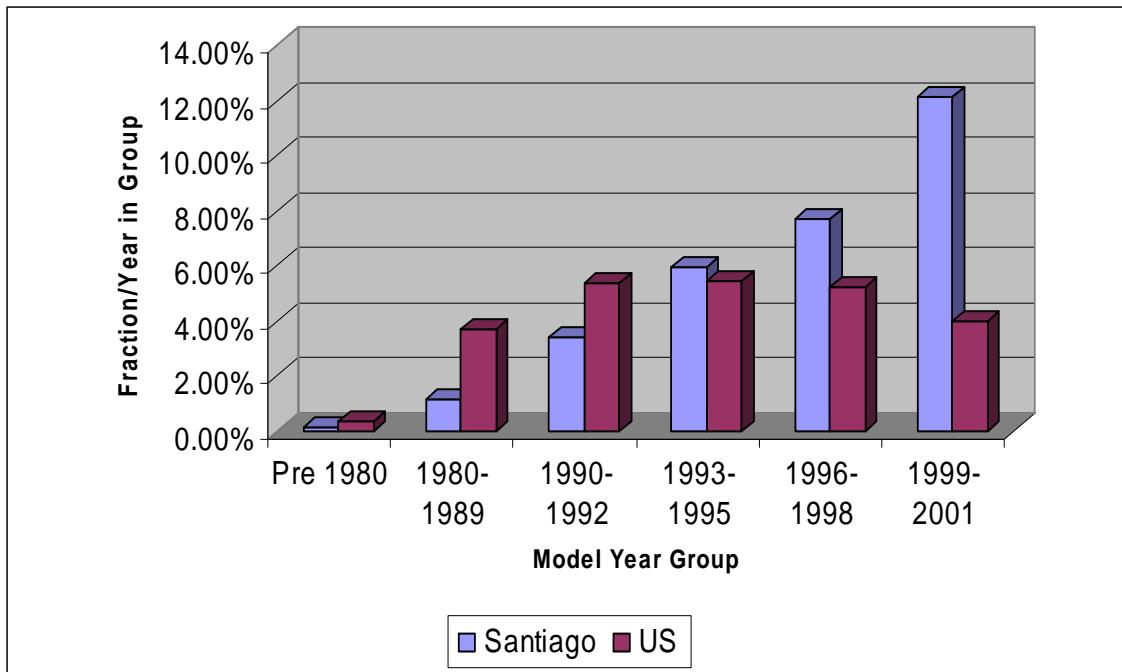

### Fleet Distribution

Passenger vehicles makeup almost 80% of the on-road fleet and are thus a key concern for vehicle analysis. 80% of the vehicles observed had a catalyst. Due to Chilean regulations, all of these catalysts after 1992 are 3-way catalyst. 3.2% of the passenger vehicles are diesel fueled based on the survey and 13% of the passenger vehicles were pickup trucks. The survey indicated that 33% of the vehicles had air conditioning and 12% had automatic transmission. There was an obvious difference between the Maipu data (lower income area of Santiago metro) and the Vitacura data (upper income area of Santiago metro). This difference is demonstrated in Table 3.2.

**Table 3.2: Comparison of Key Passenger Fleet Data Summaries Over Santiago Metro Area**

Location	Average Age	Average Usage (Km)	Average Engine Size (l)	Air Conditioning	Automatic Transmission
Maipu	1994.4	99,107	1.69	15%	2.4%
Santiago	1995.2	89,066	1.76	23%	7.3%
Vitacura	1996.3	85,895	1.93	52%	24.9%
Taxi	1996.0	199,579	1.62	0%	0%

Figure 3.1 presents a comparison of model year data compared to the United States [U.S. EPA]. The years are grouped to make the results more statistically robust.

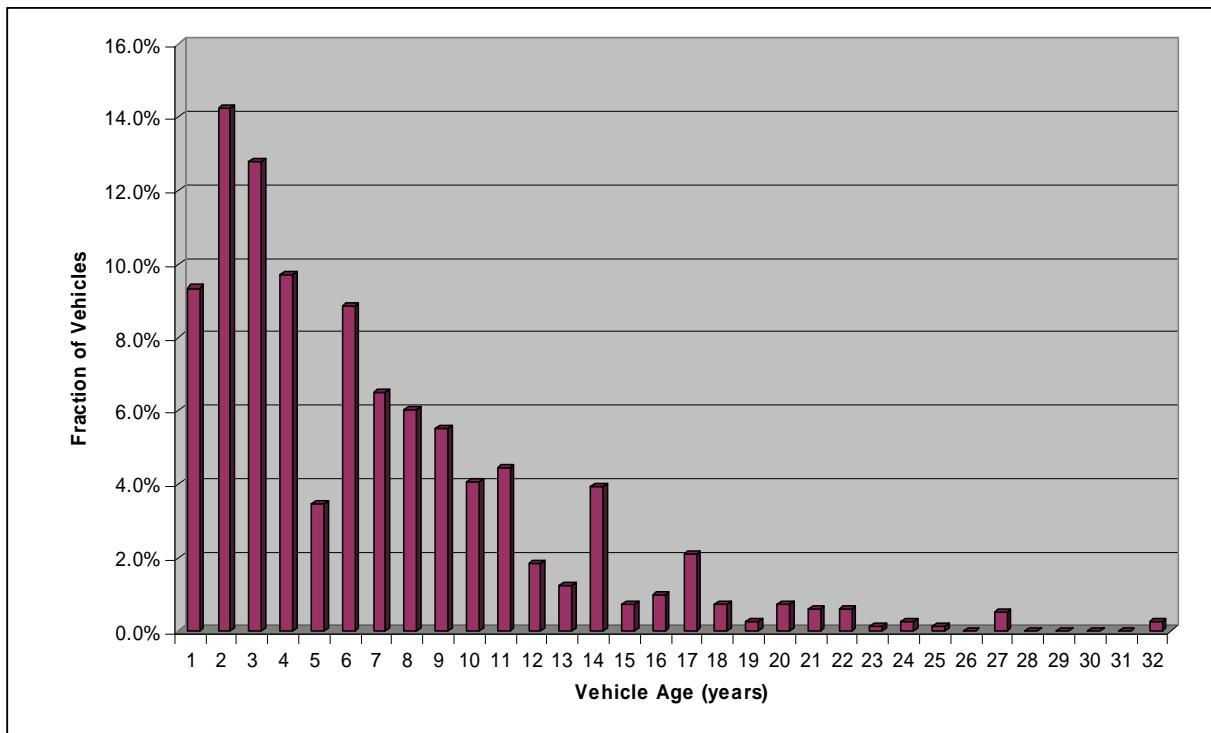

**Figure 3.1: Comparison of Fraction of Various Model Years in Santiago Fleet Compared to US Fleet (fraction per year for each model year grouping)**

As shown in Figure 3.1, the Santiago fleet is actually on the average newer than the U.S. fleet. This is likely due to the rapid growth of the Santiago fleet (~10% per year [CONAMA] resulting from recent economic growth and the fact that only about 1 person in 6 owns a vehicle in Santiago compared to almost 1 vehicle per person in the U.S. It should be noted that recent emission standards in Chile are not as stringent as those in the

U.S. Thus, the average emissions in the Chilean fleet will still likely be higher than the case for the U.S. fleet even though it is newer.

Figure 3.2 presents an analysis of the data collected in the Santiago metropolitan area by individual model year. 1-year-old vehicles represent 2001 model year in this figure. Due to the overall sample size, there were as many as 116 vehicles in some age groups while only 1 or none in other age groups. Thus, some of the inconsistencies in the results may come from the small number of vehicles in a particular sample. It is also possible that the economic conditions impact year-to-year sales and thus the fraction of vehicles in a given age group. The potential sampling errors combined with annual vehicle sales make it difficult to adjust the sampled data in any rational manner. In addition, 2001 vehicles continue to be sold in Santiago and may incur significant additional sales through the end of the year. The 5-year-old vehicles, 1997 model year, clearly appear to be lower than any reasonable sales variation would predict and thus likely indicate sampling error.

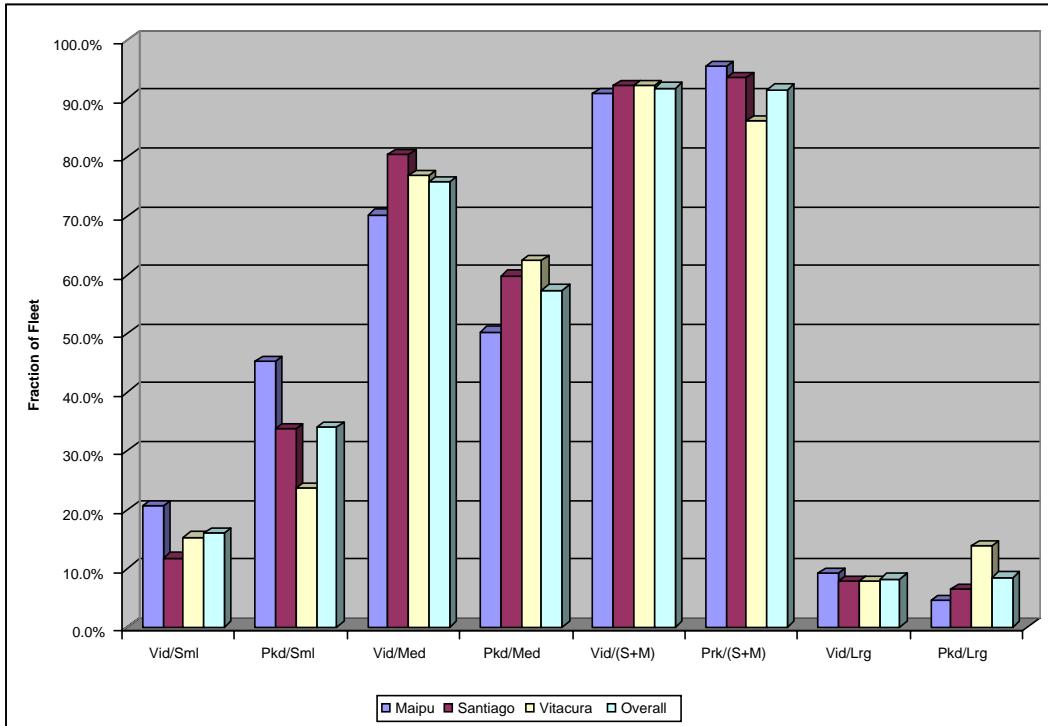

**Figure 3.2: Model Year Distribution of the Metropolitan Santiago Fleet**

An important characteristic of the vehicle fleet is the size distribution of the passenger fleet. This will influence the fuel use by this sector of the fleet. Table 3.3 shows the overall passenger fleet vehicle distribution derived from the walk-around data broken into three size groups as used in the IVE model.

**Table 3.3: Vehicle Engine Size Distribution in Various Parts of the Santiago Metro Area**

Location/Engine Size	Vehicle Count	Fraction
<b>Maipu</b>		
Small (0.6-1.5 liter engine)	131	45.2%
Medium (1.6-2.4 liter engine)	146	50.3%
Large (2.4 and larger liter engine)	13	4.5%
Total	290	
<b>Santiago</b>		
Small (0.6-1.5 liter engine)	74	33.8%
Medium (1.6-2.4 liter engine)	131	59.8%
Large (2.4 and larger liter engine)	14	6.4%
Total	219	
<b>Vitacura</b>		
Small (0.6-1.5 liter engine)	72	23.7%
Medium (1.6-2.4 liter engine)	190	62.5%
Large (2.4 and larger liter engine)	42	13.8%
Total	304	
<b>Overall</b>		
Small (0.6-1.5 liter engine)	277	34.1%
Medium (1.6-2.4 liter engine)	467	57.4%
Large (2.4 and larger liter engine)	69	8.5%
Total	813	

As shown earlier in Table 3.2, the vehicle fleet tends to be larger in the Vitacura section of Santiago Metro compared to the Maipu section of Santiago Metro. Overall, 34% of the Santiago Metro fleet are small vehicles while 8.5% are large vehicles. It is also valuable to compare this data with the on-road data collected by the video cameras in comparable areas. It should be noted in making these comparisons that it is difficult to discern between the small and medium size passenger vehicle categories on the video tape because the vehicles exist in a almost a continuum from 0.6 liter engines to 2 liter engines and it is not easy to differentiate between a 1.5 liter and 1.6 liter vehicle in order to place them in the proper size category. There is a more discernable jump in the case of medium to larger vehicles and this data is expected to be more comparable. Figure 3.3 compares the two measurements. As can be seen in Figure 3.3, the comparisons with respect to larger vehicles is reasonably good as well as the sum of the small and medium vehicle passenger fleets. There is a significant difference between the video and parked vehicle comparisons for small passenger vehicles. As discussed earlier, this may well be an inability to differentiate between 1.4 and 1.5 liter vehicles and 1.6 liter vehicles given that these three engine sizes dominate the fleet. The parked vehicle data should be more accurate than the video data for these types of differentiations.

**Figure 3.3: Comparison of Video and Parked Vehicle Collected Data**

### **Vehicle Activity**

The average vehicle usage in Santiago based on the data collected in this study is 16,600 Km per year [CONAMA]. This compares to about 19,200 Km per year in the U.S. [ref: U.S.D.O.T. National Transportation Statistics 2000 – by Bureau of Transportation Statistics, Report No. BTSO1-O1]. There is reason to believe that the 16,600 Km determined in this study may be biased high. This high bias results from the fact that it is more likely that the survey approach will find the more active vehicles since they are more likely to be found at supermarkets and shopping centers. These vehicles will have a higher average usage, which will lead to a high biased usage value. CONAMA reports that they believe that the typical usage is closer to 14,500 Km per year [CONAMA].

If it is assumed that the fleet observed in this portion of the experiment is representative of vehicle activity as opposed to base fleet composition, some corrections should be made to the data as follows.

Assume that

$N_i$  = actual number of vehicles in the  $i$ th usage group in an urban area.

$M_i$  = annual usage defined for the  $i$ th group.

Then,

$$\text{Total number of vehicles} = N_T = \sum N_i \quad (3.1)$$

$$\text{Total distance driven} = S_T = \sum (N_i * M_i) \quad (3.2)$$

$$\text{Average fleet usage} = A = S_T/N_T = \left( \sum (N_i * M_i) \right) / \left( \sum N_i \right) \quad (3.3)$$

If a total of  $K$  vehicles are randomly sampled then the probability of seeing a vehicle in the group is,

$$\text{Probability} = \left( N_i * M_i \right) / \left( \sum (N_i * M_i) \right) \quad (3.4)$$

and

$$\text{Likely number of vehicles observed} = N_{oi} = K * \left( N_i * M_i \right) / \left( \sum (N_i * M_i) \right) \quad (3.5)$$

where

$$K = \sum N_{oi}$$

Substituting equation (3.5) into equation (3.3) and solving for  $N_i$  yields,

$$N_i = (N_{oi}/K) * (S_T/M_i) \quad (3.6)$$

and

$$A = K / \left( \sum (N_{oi}/M_i) \right) \quad (3.7)$$

Equation (3.6) can also be rewritten as

$$(N_i/N_T) = (N_{oi}/K) / (M_i/A) \quad (3.8)$$

Equation (3.8) makes the point that the actual fraction of vehicles in the  $i$ th use group of the base fleet is equal to the fraction of vehicles observed in the  $i$ th use group divided by the ratio of mileage in the  $i$ th use group to the actual fleet average.

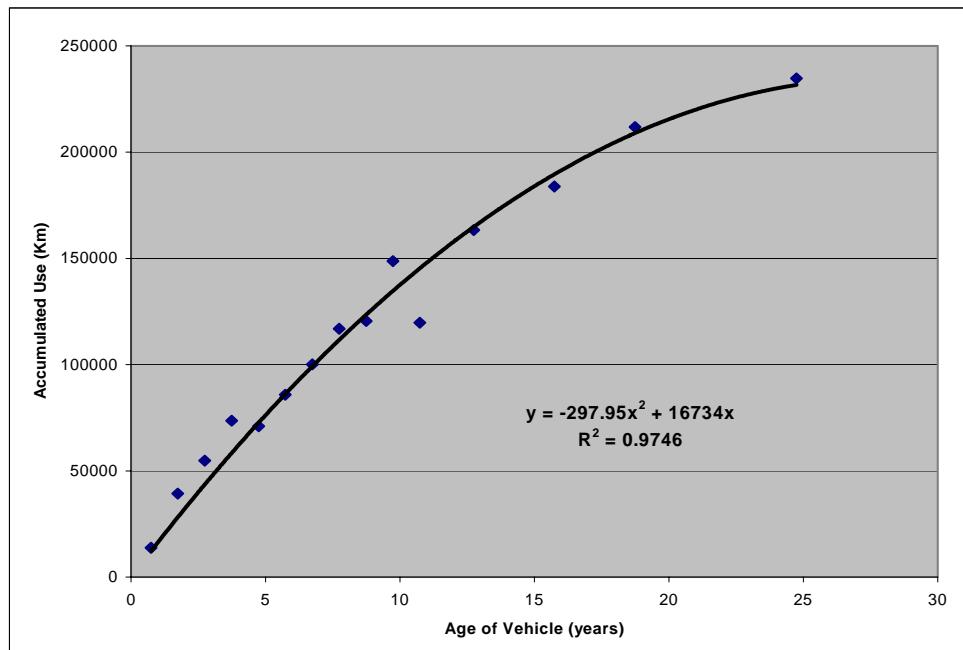

Table 3.4 indicates the observed usage distribution for vehicles in the 1994 to 2000 age group. This group was selected for evaluation because the age of the vehicle is more reliable.

**Table 3.4: Observed Vehicle Usage Distribution for Vehicles in the 1994-2000 Age Group**

Annual Usage Range (1000s of Km)	Mid-Point of Annual Usage (Km)	Number of Vehicles Observed
0 to 9	5,000	81
10 to 19	15,000	387
20 to 29	25,000	131
30 to 39	35,000	27
40 to 49	45,000	9
50 to 59	55,000	6
60 to 69	65,000	2
	<b>Total Vehicles (K)</b>	<b>643</b>

Using the values in Table 3.4 in equation (3.6) produces an actual average annual vehicle use of 13,300 Km for this group of 1994 to 2000 group of vehicles. These contrasts with the straight average of 16,600 Km noted earlier. If the surveyed data does correspond to the fleet activity distribution then the correct average driving for overall Santiago is 13,300 Km. As noted earlier, CONAMA reports that the average annual driving in Santiago is 14,500 Km. If the 14,500 reported by CONAMA is correct, then the straight average value of 16,600 Km per year is 14.5% higher than the reported value while the activity corrected factor is 8.2% below the reported value. This is not an issue for the fleet distributions developed in this report since the interest is in activity related distributions. However, it is an important consideration when comparing data collected from on-road counts or parking lot counts with data extracted from vehicle registration data in government data banks.

Figure 3.4 shows the accumulated vehicle usage derived in this study compared to vehicle age.

**Figure 3.4: Accumulated Driving in the Overall Santiago Fleet.**

A second order fit to the data is also presented. This fit was forced to go through zero since new vehicles will have no accumulated use by definition. The results resemble those observed in the U.S. in the sense that newer vehicles are used more than older vehicles. The values used in the plot for the older vehicles are suspect both from the fact that it was difficult in the field to assign an age to these vehicles and the additional problem that the odometer may have turned over one or more times and this was not determinable from a walk-by survey. These factors may cause Figure 3.4 to indicate lower mileage in higher years than is actually occurring. However, without better data, there is no way to correct this problem.

Table 3.5 uses the second order fit shown in Figure 3.4 to estimate accumulated vehicle driving and then to calculate annual estimated vehicle driving by vehicle age. As can be seen, vehicles in the first three years of their life are driven 15,000-16,000 kilometers per year. Vehicles that are 15-18 years old are driven only 6,000-8,000 kilometers per year. This reduced driving at higher age will reduce the impact of older vehicles on air pollution. Table 3.5 also presents similar data for the United States [U.S. EPA]. As can be seen U.S. drivers drive significantly more than Chilean drivers, but the U.S. shows a similar reduction in driving as vehicles age. The significant difference in driving in the U.S. at higher ages is likely the result of the data collection method discussed in the previous paragraph.

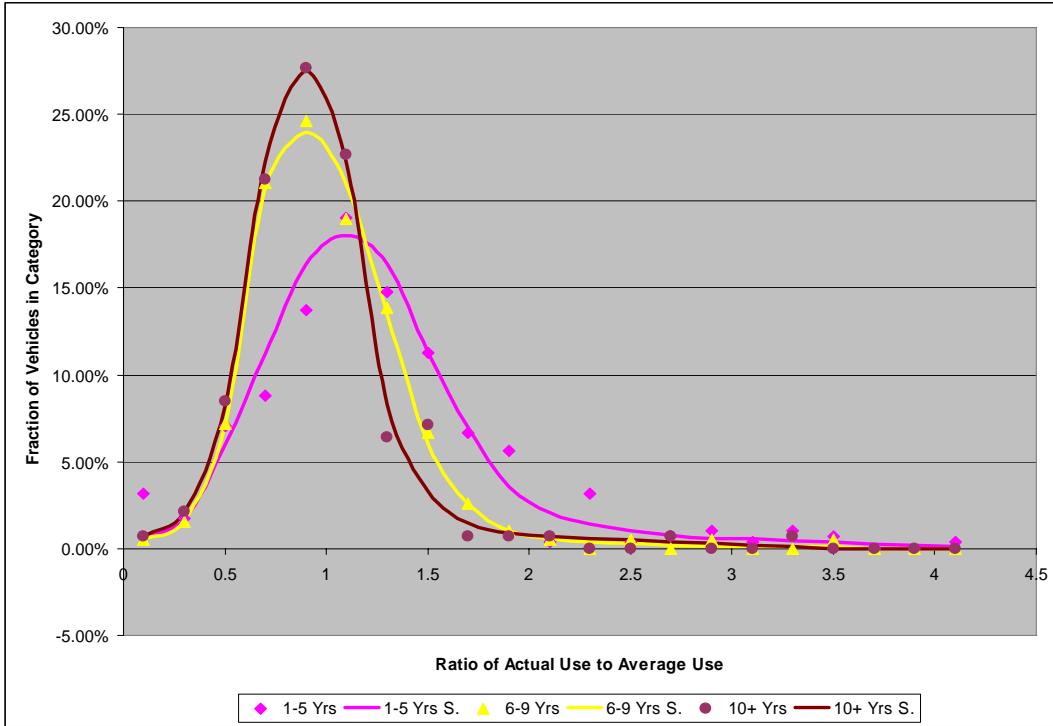

**Table 3.5: Estimated Annual Driving by Vehicle Age**

<b>Vehicle Age (years)</b>	<b>Projected Accumulated Driving (Km)</b>	<b>Annual Driving (Km)</b>	<b>Annual U.S. Driving (Km)<sup>3</sup></b>	<b>U.S./Chilean Ratio</b>
1	16,436	16,436	26,917	1.63
2	32,276	15,840	25,420	1.60
3	47,520	15,244	24,002	1.57
4	62,169	14,648	22,654	1.54
5	76,221	14,052	21,373	1.52
6	89,678	13,457	20,157	1.49
7	102,538	12,861	19,003	1.47
8	114,803	12,265	17,911	1.46
9	126,472	11,669	16,878	1.44
10	137,545	11,073	15,904	1.43
11	148,022	10,477	14,986	1.43
12	157,903	9,881	14,126	1.43
13	167,188	9,285	13,325	1.43
14	175,878	8,689	12,566	1.44
15	183,971	8,093	11,840	1.46
16	191,469	7,498	11,152	1.48
17	198,370	6,902	10,507	1.52
18	204,676	6,306	9,905	1.57
19	210,386	5,710	9,320	1.63
20	215,500	5,114	8,703	1.70
21	220,018	4,518	8,097	1.79
22	223,940	3,922	7,502	1.91
23	227,266	3,326	6,925	2.08
24	229,997	2,730	6,365	2.33
25	232,131	2,134	5,618	2.63

An important adjunct to the accumulated mileage and the typical mileage driven per year is the distribution of driving associated with each age group. Figure 3.4 and Table 3.5 above present averages derived from the whole data set. Figure 3.5 presents the distribution of driving around the average accumulated vehicle usage for three different age groupings. The data for Figure 3.5 was developed by dividing the average vehicle usage projected using the second-order equation in Figure 3.4 into the actual usage recorded for each vehicle surveyed for which an odometer reading was available. The newer vehicles (1-5 years of age) are driven over a wider range of use patterns than are the older vehicles.

<sup>3</sup> U.S. Environmental Protection Agency, EPA420-R-01-047, Sept. 2001

**Figure 3.5: Distribution of Driving Around Projected Accumulated Usage**

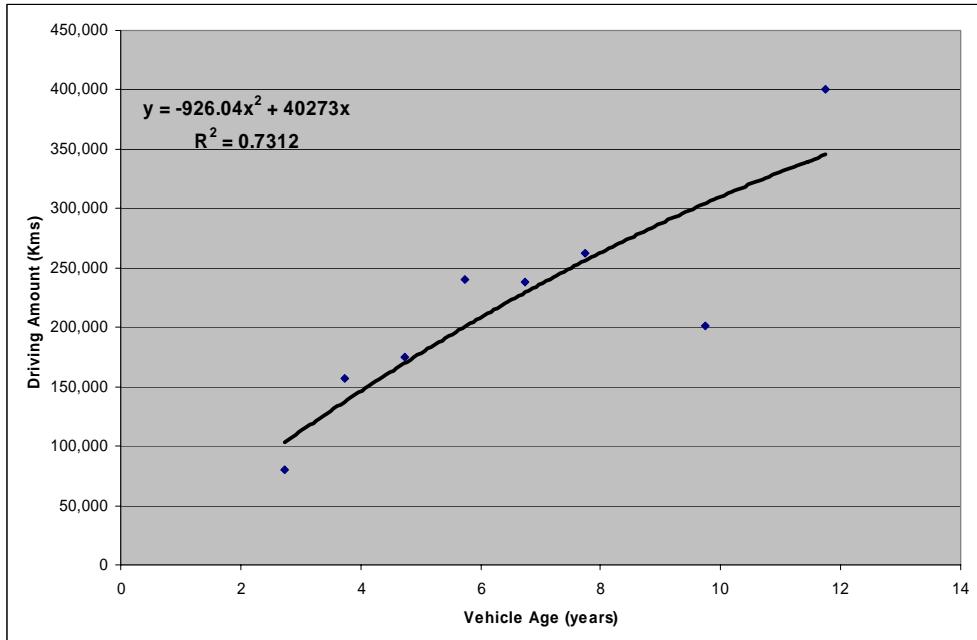

### Taxis

Only limited Taxi data was collected. The entire sample consists of 20 vehicles. However, there was significant consistency among the vehicles. All vehicles except one were in the 1.5/1.6 liter engine size. The one variance was a 1.9-liter vehicle. No taxis had air conditioning. All but one had a catalyst and none were older than 1990. Figure 3.6 shows the model year distribution of the taxi fleet. The average annual driving measured for a taxi is about 35,000 kilometers/year.

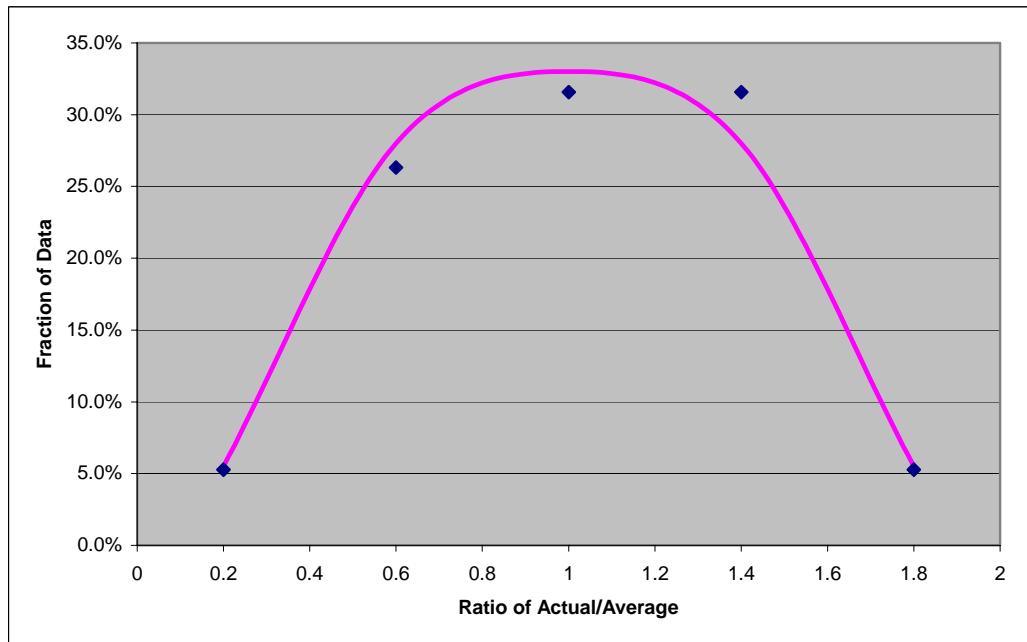

**Figure 3.6: Model Year Distribution of Taxis for Santiago**

Figure 3.7 displays the driving distribution including a second order fit forced through zero.

**Figure 3.7: Taxi Driving by Vehicle Age**

Figure 3.8 presents the distribution of driving around the projected mean.

**Figure 3.8: Taxi Driving Distribution Around Projected Means**

As noted earlier, the taxi data is very limited and the graphics presented should be considered in this light.

## **Chapter Four: Vehicle Technology Matrix Based on Video**

The International Vehicle Emissions model (IVE model), which this study is designed to support, categorizes on-road vehicles into 801 technology categories. The large number of technologies derives from the fact that the IVE model is intended to accommodate a wide array of urban areas around the world and to project emissions in these areas into the future. Thus, fuels as diverse as gasoline, diesel, ethanol, and natural gas must be accommodated along with a wide variety of control technologies for the passenger fleet, truck fleet, bus fleet, and for motorcycles. Appendix B shows the 801 technologies presently accommodated by the model.

As noted earlier, the videotapes were used to create a general breakdown of the on-road fleet. The stationary vehicle data was used to further break the passenger fleet into more finely divided subsets. The data was parsed on an excel spreadsheet into the categories of interest. Table 4.1 indicates the values used to parse the data.

**Table 4.1: Values Used to Parse Data**

	<b>Vehicle Size (based on engine size in liters)</b>	<b>Vehicle Usage (based on amount driven or model year in thousands of Km)<sup>4</sup></b>
Small/Low	0.5-1.5	0-79
Medium/Medium	1.6-2.4	80-159
Large/High	2.5-5	160-1,000

Using Tables 2.2 a, b, c a breakdown of on-road vehicle use was created and is shown in Table 4.2. The values shown in Table 4.2 were created by equally weighting the highway (freeway), arterial, and residential information and averaging it. The overall fleet data are created by equally weighting all of the video produced data and averaging it. A more accurate distribution can be created by determining the relative amount of driving that is occurring on residential streets compared to arterial streets compared to highways and weighting the activity data. Similarly an improved overall data set can be developed by determining the relative amount of driving that is occurring in Maipu like settings compared to Santiago type settings compared to Vitacura type settings. This information is not available at the present. Thus, equal weighting is being used for the present.

---

<sup>4</sup> In cases where the odometer reading was visible, the value observed on the odometer was used. If no odometer reading was observable then a vehicle usage was approximated using the second order least squares fit equation shown in Figure 3.4. This projected odometer reading was then used to locate the vehicle in the proper use bin.

**Table 4.2: Breakdown of Vehicular Activity Based on Video Tapes of Santiago Traffic**

	Passenger Vehicles	Taxis	Medium Sized Trucks	Large Sized Trucks	Small Sized Buses	Medium Sized Buses	Large Sized Buses	Motorcycles
<b>Overall Fleet</b>	81.1%	9.2%	4.5%	0.6%	0.9%	0.4%	4%	1.4%
<b>Maipu Fleet</b>	78.9%	11.8%	4.7%	0.7%	0.9%	0.9%	1.5%	0.6%
<b>Santiago Fleet</b>	74.7%	8.7%	5.6%	1.2%	0.1%	0.3%	7.8%	1.7%
<b>Vitacura Fleet</b>	85.1%	6.4%	1.9%	0.1%	1.8%	0.1%	2.9%	1.7%

The parked car passenger vehicle information can be used to parse the passenger vehicle fractions into sub-fractions. This is accomplished by multiplying the parked car fractions for the area of interest by the overall passenger vehicle fractions in Table 4.2. Table C-5 in Appendix C presents the data for the Santiago Metropolitan Region parked car vehicle survey as an example. The resulting technology distributions for the Santiago Metropolitan Region and the sub-areas are presented in Appendix C in Tables C-1 through C-4.

As discussed in Section 3, this process assumes that the observed vehicle fractions in the case of parked cars correspond to the relative use (activity) of these vehicles. Although one would expect the parked vehicle distributions to conform reasonably well with vehicle activity, this has not been proven to be the case. However, it is the only possible process for using this data at the moment.

This technology identification portion of the study did not include data collection concerning diesel trucks and buses. Thus, no data was available to parse diesel vehicles into various age or technology categories. For the present analysis, all diesel trucks and buses are considered to be uncontrolled using pre-chamber injection technology. The age distributions were estimated based on U.S. data [reference]. Table 4.3 indicates the factors used to parse the truck and bus data into age bins. All motorcycles were assumed to be 4-cycle and of less than 79,000 Km (50,000 miles) based on discussions with CONAMA officials. This assumption needs to be tested based on future studies.

**Table 4.3: Assumptions Used to Parse Truck and Bus Data into Age Bins**

Vehicle Type	Vehicle Size		
	Low Use	Medium Use	High Use
Medium Truck	16.3%	15.5%	68.2%
Large Truck	13.0%	13.0%	74%
Small Bus	13.0%	13.0%	74%
Medium Bus	13.0%	13.0%	74%
Large Bus	13.0%	13.0%	74%

The results for the overall Santiago metro area and for the Maipu, Santiago, and Vitacura subgroups are shown in Appendix C.
